

We are...in touch

At all times during the delivery cycle, your products are accounted for via Allied's advanced Track & Trace system. For couriers and taxi-trucks, all relevant information for a job is entered by the driver via on-board data terminal; pick-up time, drop-off and receiver's name are all uploaded in real-time for your reference.

If you would like to know the suburb location of a particular job in transit, you can even access that information thanks to the fleet's GPS monitoring.

Tracking local freight begins from the moment it leaves the warehouse shelf and continues until the time it lands on the end-customer's desk. Every single item in an Allied Express vehicle is scanned through the system and ultimately electronically signed off at the point of delivery.

National express freight, particularly that going to regional areas, can pass through multiple locations. But with Track & Trace, your freight is always 'on the radar' as each consignment is scanned and logged every step of the way. As with all our other services, this data is immediately uploaded to the system and posted onto the website for your access.

With just a customer code and password, you can track your freight on-line. No matter how far it travels, you can find out time of pick-up, time of delivery; you can even view a scanned copy of an individual con-note, all from the convenience of your PC.

Allied's Track & Trace gives you the information you need to quickly and confidently monitor all your freight movements.
